In order to generate cryptographically strong elliptic curves, it is necessary to compute the number of points of the elliptic curve and to determine if that value is a prime number or if it has a small cofactor. In this regard, the Brainpool specifications only accept curves whose number of points is a prime number . This means that Brainpool curves cannot always be transformed into the twisted Edwards or Montgomery forms, as in those types of curves the number of points is always divisible ...

Elliptic-curve cryptography is an approach to public-key cryptography based on the algebraic structure of elliptic curves over finite fields. ECC allows smaller keys compared to non-EC cryptography to provide equivalent security. Elliptic curves are applicable for key agreement, digital signatures, pseudo-random generators and other tasks. Indirectly, they can be used for encryption by combining the key agreement with

Generating a secure elliptic curve is complicated and there are only a few algorithms for some special elliptic curves at present. In this paper an algorithm of generating an elliptic curve over prime field $GF(p)$ with a prime number order is discussed. Another algorithm of generating an elliptic curve with an order which equals to the product of two prime numbers is proposed.

In mathematics, an elliptic curve is a smooth, projective, algebraic curve of genus one, on which there is a specified point O . Every elliptic curve over a field of characteristic different from 2 and 3 can be described as a plane algebraic curve given by an equation of the form $y^2 = x^3 + ax + b$. $\{\displaystyle y^2 = x^3 + ax + b.\}$ The curve is required to be non-singular, which means that the curve has no cusps or self-intersections. It is always understood that the curve is really sitting in

This paper proposes the tree and elliptic-curve based group key agreement protocol. For efficient communication, the proposed technique uses the divide-and-conquer strategy and built the tree-like structure. For achieving security this approach uses an elliptic-curve based Diffie – Hellman approach with the same level of security in less key size.

Then, an algorithm for generating a secure elliptic curve with Montgomery-form is presented. The most important advantages of the new algorithm are that it avoids the transformation from an elliptic curve's Weierstrass-form to its Montgomery-form, and that it decreases the probability of collision.

Elliptic Curve Cryptography (ECC) is a branch of public-key cryptography based on the arithmetic of elliptic curves. In the short life of ECC, most standards have proposed curves defined over prime finite fields using the short Weierstrass form. However, some researchers have started to propose as a more secure alternative the use of Edwards and Montgomery elliptic curves, which could have an impact in current ECC deployments.

An elliptic curve is the set of solutions (x,y) to an equation of the form $y^2 = x^3 + Ax + B$, together with an extra point O which is called the point at infinity. For applications to cryptography we consider finite fields of q elements, which I will write as F_q or $GF(q)$. When q is a prime one can think of F_q as the integers modulo q .
